

Shortest Path in Unweighted Graph

Solved

Difficulty: **Medium** Accuracy: **49.98%** Submissions: **200K+** Points: **4** Average Time: **20m**

Given an undirected graph with **V** vertices numbered from 0 to V-1 and **E** edges, where **edges[i] = [u, v]** denotes an undirected edge between vertex u and vertex v, given two vertices **src** and **dest**, find the length of the shortest path from src to dest. If there is no path between src and dest, return -1.

Note: All edges have a unit weight of 1.

Examples :

Input: V = 9, edges[][] = [[0, 1], [0, 3], [1, 2], [3, 4], [4, 5], [2, 6], [5, 6], [6, 7], [6, 8], [7, 8]], src = 0, dest = 8

Output: 4

Explanation: One of the shortest paths from vertex 0 to vertex 8 is 0 -> 1 -> 2 -> 6 -> 8, which contains 4 edges.

Input: V = 4, edges[][] = [[0, 3], [1, 3]], src = 3, dest = 2

Output: -1

Explanation: There is no path between vertices 3 and 2.
